THE JAPANESE GOVERNMENT BOND PERFORMANCE INDEX IN THE EARLY SHOWA ERA

By KENICHI HIRAYAMA

〈SUMMARY〉

Using “Government Bond Performance Index in the early Showa era (GBPI),” this paper makes clear that the changes in investment results (return & risk) and market characteristics (compound interest yields & average remaining years to maturity) of the government bond market. According to the GBPI, the return and risk in the government bond market from 1924 to 44 were 5.71% and 2.04%. The risk level of the government bond market had continued to decline since 1931, and became a same level of short-term financial market in 1942.
